

DISCUSSION

Q : P. Permadi (PT. HKI Sampoerna Agro)

What is the tapping frequency used when the rubber price increase or decrease?

A : Eric Francis Soumahin

In our study, we only used one price of rubber (0,6 USD/kg)

Q : Dadang Suparto (Rubber Association of Indonesia)

Mg and P contents have influence to the latex stability. Did you measure the MST of latex field or latex concentrate? Please explain if you measure sulphur content in rubber?

A: L. Vaysse

MST was measured in the field on fresh latex (though MST was designed for stabilized latex). Unfortunately, sulphur was not measured.

Q: Muhammad Fadzli Ali (Malaysian Rubber Board)

1. Is there any difference of stimulation recommendation for multi-clones in one smallholding?
2. Does the response of stimulation differ according to the age of the trees?

A: Sagari Kudaligama

1. No, still at C panel. The yield are comparable to traditional S/2 d2 system
2. No problem if all the clones are in same metabolic status.

Q: KJ Yap

What is the reason for reducing the yield of S/2 d3 rather than S/2 d2?

A: Sagari Kudaligama

There was a typographical error instead of 1,83 kg/year, it should be changed to 2,83 kg/year
